Laporan Akhir Praktikum Jaringan Komputer

Firewall & NAT

Hasya Rihadatul Aiza - 5024241036

2026

1 Langkah-Langkah Percobaan

1.1 Praktikum 1: Konfigurasi Cisco Switch

Langkah pertama yang dilakukan adalah masuk ke mode privileged exec pada Cisco Switch, lalu lanjut ke mode konfigurasi global.

Setelah masuk ke mode konfigurasi, dibuat empat VLAN sekaligus dengan nama masing-masing sesuai divisi yang akan menggunakannya.

Gambar 1: Pembuatan VLAN 10, 20, 30, dan 40 pada Cisco Switch

Untuk memastikan VLAN sudah terbuat dan statusnya aktif, dilakukan verifikasi dengan perintah `show vlan brief`.

Gambar 2: Hasil `show vlan brief` yang memperlihatkan VLAN 10, 20, 30, dan 40 aktif

Selanjutnya, setiap port yang terhubung ke PC dikonfigurasi sebagai access port dan diarahkan ke VLAN yang sesuai.

```

Switch#conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#interface gi0/2
Switch(config-if)#description PC-FINANCE-VLAN10
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 10
Switch(config-if)#no shutdown
Switch(config-if)#exit
Switch(config)#interface gi0/1
Switch(config-if)#description PC-HR-VLAN20
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 20
Switch(config-if)#no shutdown
Switch(config-if)#exit
Switch(config)#interface gi0/3
Switch(config-if)#description PR-MARKETING-VLAN40
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 40
Switch(config-if)#no shutdown
Switch(config-if)#xit

```

Gambar 3: Konfigurasi access port untuk masing-masing VLAN

Setelah access port selesai, port yang terhubung ke Cisco Router dikonfigurasi sebagai trunk port agar bisa membawa traffic semua VLAN sekaligus. Verifikasi trunk dilakukan dengan perintah `show interfaces trunk`, lalu konfigurasi disimpan dengan `write memory`.

```

Port      Mode      Encapsulation  Status      Native vlan
Gi0/0     on        802.1q         trunking    1

Port      Vlans allowed on trunk
Gi0/0     10,20,30,40

Port      Vlans allowed and active in management domain
Gi0/0     10,20,30,40

Port      Vlans in spanning tree forwarding state and not pruned
Gi0/0     10,20,30,40

```

Gambar 4: Hasil `show interfaces trunk` yang memperlihatkan VLAN 10, 20, 30, dan 40 dibawa oleh port Gi0/0

1.2 Praktikum 2: Konfigurasi Cisco Router

Praktikum ini mengimplementasikan metode Router-on-a-Stick (ROAS), di mana satu interface fisik router dibagi menjadi beberapa subinterface untuk menangani routing antar-VLAN. Pertama, interface fisik yang terhubung ke switch diaktifkan tanpa IP address, lalu dibuat subinterface untuk masing-masing VLAN sekaligus dikonfigurasi sebagai gateway tiap jaringan. Pada tahap yang sama, DHCP server dikonfigurasi untuk VLAN 10 dan VLAN 20.

```

Terminal
Switch x CISCO x VPC x VPC x VPC x VPC x
Router(config)#interface gig0/2.40
Router(config-subif)#description GATEWAY-VLAN40-MARKETING
Router(config-subif)#encapsulation dot1Q 40
Router(config-subif)#ip address 192.168.40.1 255.255.255.0
Router(config-subif)#no shutdown
Router(config-subif)#exit
Router(config)#ip dhcp excluded-address 192.168.10.1 192.168.10.10
Router(config)#ip dhcp pool VLAN10-FINANCE
Router(dhcp-config)#network 192.168.10.0 255.255.255.0
Router(dhcp-config)#default-router 192.168.10.1
Router(dhcp-config)#dns-server 8.8.8.8
Router(dhcp-config)#exit
Router(config)#ip dhcp excluded-address 192.168.20.1 192.168.20.10
Router(config)#ip dhcp pool VLAN20-HR
Router(dhcp-config)#network 192.168.20.0 255.255.255.0
Router(dhcp-config)#default-router 192.168.20.1
Router(dhcp-config)#dns-server 8.8.8.8
Router(dhcp-config)#exit
Router(config)#ip 192.168.30.10/24 192.168.30.1
^
% Invalid input detected at '^' marker.
Router(config)#

```

Gambar 5: Konfigurasi subinterface VLAN dan DHCP pool pada Cisco Router

Verifikasi interface dilakukan dengan perintah `show ip interface brief` untuk memastikan semua subinterface sudah aktif dengan IP yang benar.

```

Terminal
Switch x CISCO x VPC x VPC x VPC x VPC x
Router(config)#ip dhcp pool VLAN20-HR
Router(dhcp-config)#network 192.168.20.0 255.255.255.0
Router(dhcp-config)#default-router 192.168.20.1
Router(dhcp-config)#dns-server 8.8.8.8
Router(dhcp-config)#exit
Router(config)#ip 192.168.30.10/24 192.168.30.1
^
% Invalid input detected at '^' marker.
Router(config)#exit
Router#
Jun 6 01:55:00.279: %SYS-5-CONFIG_I: Configured from console by console
Router#show ip interface brief

Gambar 9: Konfigurasi IP statis pada PC VLAN 40

PC VLAN 10 dan VLAN 20 melakukan request IP secara otomatis via DHCP.

Gambar 10: PC VLAN 10 berhasil mendapatkan IP via DHCP

Setelah semua PC mendapatkan IP, dilakukan verifikasi `show ip` pada PC VLAN 10 untuk mengonfirmasi detail IP yang diterima dari DHCP server.

Gambar 11: Hasil show ip pada PC VLAN 10 yang menampilkan detail IP dari DHCP

Gambar 12: Hasil show ip pada PC VLAN 20 yang menampilkan detail IP dari DHCP

Pengujian konektivitas dilakukan dengan ping ke gateway masing-masing VLAN dari setiap PC.

Gambar 13: Hasil ping dari PC VLAN 10 ke gateway 192.168.10.1

Gambar 14: Hasil ping dari PC VLAN 20 ke gateway 192.168.20.1

Gambar 15: Hasil ping dari PC VLAN 30 ke gateway 192.168.30.1

Gambar 16: Hasil ping dari PC VLAN 40 ke gateway 192.168.40.1

Pengujian antar-VLAN dilakukan dari PC VLAN 10 untuk memastikan routing melalui Cisco Router berjalan dengan baik.

Gambar 17: Hasil ping antar-VLAN dari PC VLAN 10 ke VLAN 20, 30, dan 40

Terakhir, dilakukan pengecekan kembali di Cisco Router untuk memverifikasi DHCP binding yang mencatat IP yang sudah diberikan ke masing-masing client.

Gambar 18: Hasil show ip dhcp binding yang menampilkan IP terdistribusi ke PC VLAN 10 dan 20

1.3 Praktikum 3: Konfigurasi Huawei Router dan IP Address Antarrouter

Praktikum ini fokus mengaktifkan semua link antarrouter sebelum masuk ke konfigurasi routing dinamis. Pertama, LAN sisi Huawei dikonfigurasi dengan jaringan 192.168.50.0/24 melalui interface Ethernet1/0/2.

Gambar 19: Konfigurasi interface LAN pada Huawei Router

PC yang terhubung ke LAN Huawei dikonfigurasi dengan IP statis 192.168.50.10/24, lalu dilakukan verifikasi dengan `show ip` untuk memastikan IP sudah terpasang dengan benar.

Gambar 20: Konfigurasi IP statis dan verifikasi show ip pada PC LAN Huawei

Setelah IP terpasang, dilakukan pengujian ping dari PC LAN Huawei ke gateway 192.168.50.1 untuk memastikan konektivitas ke router berhasil.

Gambar 21: Hasil ping dari PC LAN Huawei ke gateway 192.168.50.1

Selanjutnya dikonfigurasi dua link antara Cisco dan Huawei. Link pertama menggunakan network 10.10.10.0/30 pada interface Gi0/3 di Cisco dan Ethernet1/0/0 di Huawei, sedangkan link kedua menggunakan network 10.10.11.0/30 pada interface Gi0/0 di Cisco dan Ethernet1/0/4 di Huawei. Pada tahap yang sama juga dikonfigurasi link Cisco ke MikroTik menggunakan network 10.10.30.0/30 pada interface Gi0/1 Cisco.

Gambar 22: Konfigurasi link Cisco ke Huawei (link 2) dan link Cisco ke MikroTik pada Cisco Router

Konfigurasi semua link pada sisi Huawei dilakukan sekaligus, mencakup link ke Cisco pertama (Ethernet1/0/0), link ke MikroTik (Ethernet1/0/3), dan link ke Cisco kedua (Ethernet1/0/4).

Gambar 23: Konfigurasi semua link antarrouter pada Huawei Router

Konfigurasi link MikroTik ke Cisco pada interface ether2 dilakukan dari terminal MikroTik.

Gambar 24: Konfigurasi IP link MikroTik ke Cisco pada interface ether2

Verifikasi interface dilakukan di ketiga perangkat. Pada Cisco Router dilakukan dengan show ip interface brief untuk memastikan semua link sudah aktif.

Gambar 25: Hasil show ip interface brief pada Cisco Router, semua link antarrouter aktif

Verifikasi pada Huawei Router dilakukan dengan display ip interface brief untuk mengecek status semua interface.

Gambar 26: Hasil display ip interface brief pada Huawei Router

Pengujian konektivitas antarrouter dilakukan dengan ping dari masing-masing router ke tetangganya. Dari Cisco Router dilakukan ping ke semua IP link yang terhubung.

the number of interface that is down in protocol is 1

Interface	IP Address/Mask	Physical	Protocol	VPN
Ethernet1/0/0	10.10.10.2/30	up	up	--
Ethernet1/0/0.4094	128.1.138.137/16	up	up	l3vpn

Gambar 29: Hasil ping dari MikroTik ke Huawei dan Cisco Router

1.4 Praktikum 4: Konfigurasi OSPF Multivendor dan OSPF Cost

Pada praktikum ini routing dinamis OSPF dikonfigurasi di ketiga router sekaligus. Konsepnya, dua link Cisco-Huawei dijadikan jalur utama dengan cost 10, sementara jalur melalui MikroTik dijadikan backup dengan cost 100. Konfigurasi OSPF di Cisco Router dilakukan dengan mendaftarkan semua network yang perlu diiklankan sekaligus mengatur cost tiap interface.

Konfigurasi OSPF di Huawei Router dilakukan dengan mendaftarkan semua network yang dimiliki dan mengatur cost masing-masing interface sesuai peran jalurnya.

Konfigurasi OSPF di MikroTik hanya mendaftarkan dua link yang dimilikinya sebagai jalur backup dengan cost 100, lalu langsung dilakukan verifikasi neighbor.

```
[~HUAWEI]display ospf peer
(M) Indicates MADJ neighbor

      OSPF Process 1 with Router ID 2.2.2.2

Gambar 55: Hasil ping dari PC LAN Huawei ke seluruh jaringan VLAN Cisco

1.5 Praktikum 5: Pengujian Failover OSPF

1.5.1 Kondisi Normal, Dua Link Cisco-Huawei Aktif

Pertama-tama, dicoba dulu situasi awal dimana kedua link antara Cisco dan Huawei masih sama-sama hidup. Dicek tabel routing di router Cisco ke arah LAN Huawei, lalu dari PC yang ada di VLAN dilakukan trace ke LAN Huawei buat liat jalur yang dilewati pakatnya. Karena dua link masih aktif, hasilnya traffic langsung lewat jalur Cisco ke Huawei tanpa nyebrang ke MikroTik.

1.5.2 Kondisi Satu Link Cisco-Huawei Mati

Habis itu, salah satu link Cisco-Huawei dimatikan dengan masuk ke mode konfigurasi interface gi0/3 lalu di-shutdown. Setelah itu dicek lagi rute dari Cisco ke LAN Huawei dan dilakukan trace lagi dari PC VLAN ke LAN Huawei. Walaupun satu link udah mati, traffic masih tetap lewat jalur langsung Cisco-Huawei, soalnya masih ada satu link yang nyambung.

1.5.3 Kondisi Dua Link Cisco-Huawei Mati

Lanjut, link Cisco-Huawei yang kedua juga dimatikan dengan cara yang sama, kali ini di interface gi0/0 yang di-shutdown. Dicek lagi rute dari Cisco ke LAN Huawei dan dilakukan trace lagi dari PC VLAN ke LAN Huawei. Karena kedua link utama udah mati semua, rute otomatis pindah ke jalur

```

Router>show ip route 192.168.50.0
Routing entry for 192.168.50.0/24
  Known via "ospf 1", distance 110, metric 11, type intra area

    10.10.10.2 3 msec
  2 192.168.50.10 9 msec 5 msec 5 msec

```

Gambar 56: Hasil show ip route dan trace saat dua link Cisco-Huawei aktif

backup lewat MikroTik. Jalurnya jadi PC VLAN -> Router Cisco -> MikroTik -> Router Huawei -> LAN Huawei.

1.5.4 Mengaktifkan Kembali Dua Link Cisco-Huawei

Terakhir, kedua link yang sempat dimatikan tadi diaktifkan lagi dengan masuk ke mode konfigurasi dan menjalankan no shutdown di interface gi0/3 dan gi0/0. Setelah itu dicek lagi rute dari Cisco ke LAN Huawei dan dilakukan trace lagi dari PC VLAN ke LAN Huawei. Setelah kedua link nyala lagi, jalur routing balik lagi ke link utama Cisco-Huawei kayak kondisi awal.

```

Gambar 58: Hasil show ip route dan trace saat kedua link Cisco-Huawei mati, rute melewati MikroTik

2 Analisis Hasil Percobaan

Secara keseluruhan, seluruh rangkaian praktikum dari Praktikum 1 hingga Praktikum 5 berhasil diselesaikan sesuai hasil yang diharapkan. Pada Praktikum 1, Cisco Switch berhasil dikonfigurasi dengan empat VLAN beserta access port dan trunk port yang tepat. Praktikum 2 berhasil menerapkan metode ROAS pada Cisco Router sehingga setiap VLAN mendapatkan gateway-nya masing-masing dan PC di VLAN 10 serta 20 dapat memperoleh IP secara otomatis via DHCP, termasuk komunikasi lintas VLAN yang berjalan lancar. Praktikum 3 berhasil mengaktifkan semua link antarrouter, baik dua link Cisco-Huawei, link Huawei-MikroTik, maupun link Cisco-MikroTik, dengan seluruh router mampu saling ping ke tetangganya. Praktikum 4 berhasil menjalankan OSPF multivendor antara Cisco, Huawei, dan MikroTik dalam satu area yang sama, di mana semua router saling bertukar informasi routing dan PC di jaringan VLAN maupun LAN Huawei bisa saling berkomunikasi end-to-end. Praktikum 5 kemudian membuktikan bahwa mekanisme failover OSPF bekerja dengan baik, traffic berpindah ke jalur backup melalui MikroTik ketika kedua link utama Cisco-Huawei dimatikan, dan kembali ke jalur utama begitu link diaktifkan kembali. Dalam proses pengerjaan, terdapat beberapa kendala teknis yang ditemui, terutama terkait lingkungan laboratorium yang menggunakan virtualisasi di Linux, di mana proses booting router dan switch virtual kadang memakan waktu cukup lama dan sesekali terminal mengalami error sehingga perlu dilakukan restart pada VM atau emulator yang digunakan, namun hal ini tidak berdampak pada hasil akhir konfigurasi.

3 Kesimpulan

Praktikum ini berhasil mempelajari konfigurasi VLAN, ROAS, DHCP server, dan routing dinamis OSPF pada lingkungan multivendor yang melibatkan Cisco, Huawei, dan MikroTik. Seluruh tujuan praktikum dapat dicapai, mulai dari segmentasi jaringan menggunakan VLAN, penerapan inter-VLAN routing, pengalamatan link antarrouter, hingga distribusi routing via OSPF dengan mekanisme failover yang terbukti berfungsi. Dengan demikian, praktikum ini menjawab tujuan utamanya yaitu memahami cara mengonfigurasi VLAN dan OSPF pada berbagai platform sekaligus menghadapi tantangan interoperabilitas yang nyata dalam lingkungan multivendor.
